

The Genealogy and Genome of Homo magnum This book is a continuation of the series started in The Day the Neutrino Died. Each fictional short story is independent, but you will find some continuation of plot and characters in various stories. I continue to strive to bring real science into science fiction and to do that I must give the reader quite a bit of background about the real science and its history. Hopefully, my stories will inspire readers of all ages to dig into the real science. But, to the work at hand, the contents of this book and my comments on them are as follows: Perhaps before I Die This brief essay represents some afterthoughts concerning the story "The Day the Neutrino Died." There are two points: (i) if a supernova goes off nearby (before I die) we should have a clear indication of whether or not some sort of "neutrino" exists; (ii) the original inspiration for the neutrino (beta decay) might have an alternative explanation (not involving neutrinos), but that would not invalidate the concept of neutrinos in other types of processes (e.g., annihilation of electrons and positrons). Indeed, the "neutrino" of today is rather different from the neutrino that Paul and Fermi described. The Genealogy and Genome of Homo magnum Parts 1 and 2 These are not time sequenced, but rather represent different viewpoints of a series of events. In spite of what some of my friends think, I think that there are relatively few ways that basic biochemistry can perform. Moreover, the system that evolved here on earth is not only robust, but it happened rather quickly. If there were alternative mechanisms for biochemistry to evolve on this or other planets, I suspect that the system that evolved first would generally wipe out other living things. On the other hand, the development of multicellular organism may take various turns and we might see rather odd adaptations of our biochemistry in alternative developmental biology. Franklin's Number I provide a hypothesis about Franklin's kite experiment which some have questioned and explore how his science and his private life may have been associated. Our Own Worst Enemy I have recently been involved with safety training for a large research biomedical organization and this set me to thinking about the possibilities. Tipping Point I could not resist getting into the politics and debate about global warming. There is an interesting history here and most people don't have much context. The one thing that I am sure of is that when someone tells you that any element of science is settled (beyond dispute) they are a fool or are intentionally trying to mislead. Shutting off debate is a political tactic, not a scientific methodology.
